## Problem

### Statement

In emergencies, patients may be unconscious, unable to communicate, or unaware of their critical medical information. Responders may therefore lack immediate access to important details such as allergies, medications, existing conditions, or emergency contacts. Design and develop a privacy-first emergency information system that provides authorized responders with essential medical information within seconds while ensuring that access is temporary, controlled, and under the patient's control.

## DOMAIN FiNTECH

### *Problem* Statement

Scammers show shopkeepers and vendors fake “payment successful” screenshots to dodge paying for goods, since these screenshots closely mimic real UPI apps (GPay, PhonePe, Paytm) and are hard to tell apart at a glance. Implement a solution where a vendor flags the screenshot as Genuine, Suspicious, or Fake with a reason.
